

'For the Love of the Republic'

Education, Empowerment, and Religion

Selim Gulesci (Bocconi) Erik Meyersson (SITE)

Summer School on Gender Economics and Society
7 July 2015

Introduction: Motivation

- ▶ Despite educational gains in Muslim countries, women's labor force participation is low (World Bank 2010) and women's rights remain weak (UNDP 2005).
 - ▶ Social norms may limit labor force participation of Muslim women more than others (Field *et al*, 2010)
- ▶ Can education policies alone improve women's status in societies with very low female labor force participation?
 - ▶ Little evidence on causal effects of education on women's status in majority-Muslim settings (Breierova and Duflo, 2004; Alam *et al*, 2011)

Female Labor Force Participation Rates

Question: Can education improve women's status..?

... in a majority-Muslim setting?

- ▶ We study a change in compulsory schooling laws in Turkey to provide evidence on the following questions:
- ▶ Does an increase in *secular* education:
 - ▶ reduce religiosity?
 - ▶ enable women to have greater influence on decisions affecting their lives?
 - ▶ improve social mobility?
- ▶ If schooling improves women's status [despite low labor force participation], through what channels?

Main Findings

- ▶ Reform increased (on average) women's schooling by 1 year, weak impact on men's schooling
- ▶ Higher schooling caused by the reform led to
 - ▶ lower religiosity: headscarf use, prayer (namaz), Quran course
 - ▶ greater decision-making power for women
 - ▶ less likely to have arranged marriages or receive brideprice
 - ▶ more likely to influence decisions in the household (e.g. contraception)
 - ▶ no effect on age at marriage or first birth
 - ▶ higher durables consumption: coming from 'female assets' (dishwasher, washing machine, Hoover)
- ▶ Education lowers religiosity, improves women's status

Main Findings II

Mechanisms: Through what channels does education improve women's status in a majority-Muslim society?

- ▶ Labor markets outcomes: weak effects.
 - ▶ small increase in labor force participation (insignificant)
 - ▶ change in occupations: self-employment ↑
- ▶ Marriage markets outcomes: weak effects.
- ▶ Average effects shield important heterogeneity by mother's education:
 - ▶ Low mother's education: effects through labor market
 - ▶ labor force participation ↑, self-employment ↑
 - ▶ High mother's education: effects through marriage market
 - ▶ husband's schooling ↑, durables consumption ↑

Interpretation of the Results

- ▶ Education can empower women and improve their wellbeing in a majority-Muslim society like Turkey, where constraints on female labor force participation are higher
- ▶ Having one more year of schooling at intermediate level weakens role for traditional institutions such as religion, arranged marriages, brideprice
- ▶ Impacts may not work through channels we'd expect
 - ▶ women from a lower socio-economic background: benefit through the labor markets;
 - ▶ women from a higher socio-economic background: benefit through the marriage markets
- ▶ Results may have been different for a reform at higher education (e.g. university)

Related Literature I : Education and Religion

- ▶ Traditional institutions (religion, caste) as constraints on women's occupational and marital choices
 - ▶ Munshi and Rosenzweig (2006); Field, Jayachandran and Pande (2010); Banerjee et al (forthcoming)
- ▶ Education → Religiosity ?
 - ▶ Modernization theory: Stark (1999), Swatos and Christiano (1999)
 - ▶ Cross-country studies show mixed results: Ianncone (1992), Barro and McVleary (2006), Deaton (2009)
 - ▶ Hungerman (2011) – negative effect of education on religious affiliation in Canada
- ▶ Our findings: Female schooling may reduce the influence of traditional institutions, in this case religion

Related Literature II : Non-Pecuniary Returns to Education

Other than its pecuniary returns, schooling has been shown to:

- ▶ Delay pregnancy and improve child health
 - ▶ Straus and Thomas (1995), Black et al (2008), McCrary and Royer (2011), Lavy and Zablotsky (2011)
- ▶ Improve marriage market outcomes
 - ▶ Becker (1991), Kremer (1997), Chadwick and Solon (2002)
- ▶ Promote empowerment (and democracy)
 - ▶ Basu and King (2001), Friedman et al. (2011), Mocan and Cannonier (2012)

Our contribution:

- ▶ Often hard to pinpoint non-pecuniary returns as returns in the labor market are likely to \uparrow as well (Oreopoulos and Salvanes 2011)
- ▶ We show that in a setting where labor market returns are low (due to low participation), there are other significant returns

The Setting: 1997 Education Reform in Turkey

- ▶ Part of military-initiated 'February Process' in 1997 to counter perceived threats to secular state.

Pre-Reform Education Path

- ▶ Compulsory 5-yr "Primary school" (6-11 yr-olds)
- ▶ Optional 3-yr "Junior high school" (12-14 yr-olds)
 - ▶ General (centralized curriculum, co-ed, headscarf ban)
 - ▶ Vocational, including religious (imam-hatip) schools.

Post-Reform Education Path

- ▶ 8 yrs compulsory "Primary Education"
- ▶ reform binding for children born after Sep '86, optional for older cohorts.
 - ▶ According to Turkish Education Law, schooling starts in September of the year a child turns 6 years old
 - ▶ The law stipulated that students in grade 4 in '97 were subject to 8 years of education

Data: 2008 Turkish Demographics Health Survey (DHS)

- ▶ 'Household module': representative sample of 10,500 hh's
- ▶ Few variables: hh roster, demographics and education
 - ▶ no info on income or expenditure
 - ▶ hh's wealth ranking: based on a standardized asset-ownership score (DHS)
- ▶ 'Ever married module': ever married women only, 8,000 obs, key outcome variables.
- ▶ Focus on the latter more detailed module
- ▶ Important to show treatment had no effect on selection into this sample, i.e. likelihood of being married in 2008.
 - ▶ Likelihood to be married not affected around the threshold
 - ▶ Within the ever-married women sample, pre-determined covariates are smooth around the threshold

Data: 'Household Module' Analysis

Gender-promoting reform, no selection into detailed 'ever married' sample

Validity - Balanced Pre-determined Covariates

Data: 'Household Module' Analysis

Outcome Mean	0.44	0.44	0.77	0.79
Bandwidth	4	5	3	5
Obs	1131	1361	1103	1827

Notes: Data is from *Turkey Demographic and Health Survey of 2008*. In columns (1) and (2), the sample is restricted to women included in the Ever-Married Women Sample while in columns (3) and (4) sample includes women in the Never-Married Women Sample. Columns (1) and (3) report reduced-form RD treatment effects of being born after 1986 for an optimal bandwidth \hat{h} determined by the Imbens and Kalyanaraman [29] algorithm, with a linear control function in month-year-of-birth on each side of the discontinuity. The forcing variable is annual age cohorts. Columns (2) and (4) report results from the specification but using the optimal bandwidth from the first-stage results (where the dependent variable is years of schooling) in column (1). Outcomes variable is years of schooling in Panel A and a dummy variable equal to one if the respondent obtained a junior-high school degree in Panel B

Data: Ever Married vs. Never Married Women

- ▶ When we compare married vs single women aged in their early 20s (around the age cutoff)
 - ▶ married women have less educated parents (mother and father)
 - ▶ married women are more likely to be born in rural areas
 - ▶ no ethnic difference
- ▶ When we estimate treatment effects of the reform for married vs single women, we find
 - ▶ No significant effect on years of schooling for single women
 - ▶ +1 year increase for married women
- ▶ Suggests reform was successful in increasing schooling among women from more conservative backgrounds, precisely the group it was intended for
- ▶ Thus, by focusing on 'ever-married' women only, we estimate a LATE that is closer to the ATT

Table: Summary Statistics for Ever Married Women

Panel A: Education			
	Mean	SD	Obs
Yrs. of Schooling	6.29	3.80	1557

Obs	1777	923	607	3279	1536	2412	1195	1849

Treatment Effect on Schooling

- ▶ Reform increased average schooling by 1 year (20%) around the cutoff
- ▶ Likelihood to complete junior high school increased by 24 ppt (not very robust)
- ▶ Likelihood to complete high school also increased: by 8-11 ppt (50%)
- ▶ Shows that the reform was successful in keeping girls in school for longer and increasing their schooling

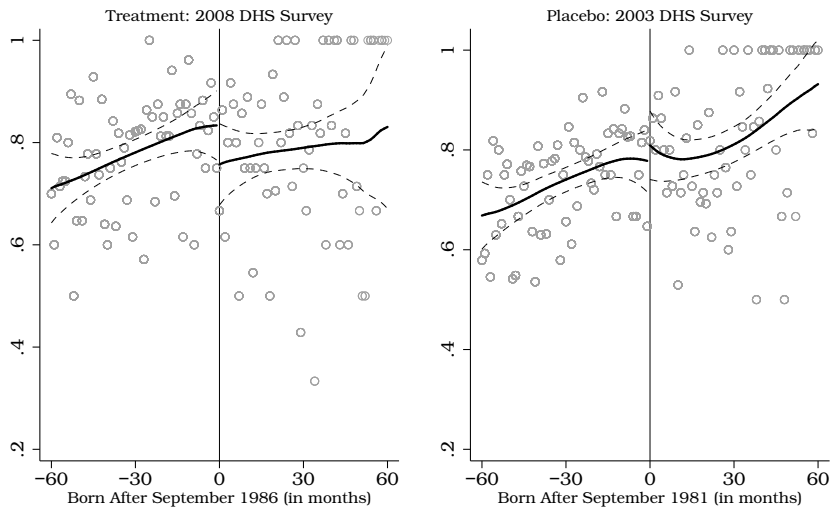

Treatment through years of schooling or less religious schooling?

The Law (1) extended compulsory schooling and (2) shut down vocational junior high school as an option.

- ▶ Part I: Finding a treatment effect on less vocational schooling overall would be consistent with dual interpretation of the reform's effects.
- ▶ Yet the reform, if anything, *increased* attainment of vocational schooling (i.e. vocational high school).
- ▶ Part II: Treatment effects on outcomes are robust to examining areas where religious schooling was known to be very low.
- ▶ In short, our interpretation of the 1997 reform is one of affecting *years* – as opposed to *type* – of schooling.

Headscarf Use

Propensity to wear Headscarf

RD Treatment Effects on Measures of Religiosity

Treatment Effect on Marriage Outcomes

- ▶ Average age at marriage or first birth unaffected

Reform enabled women to have more decision-making power in choice of partner (and timing of marriage)

- ▶ 11ppt more likely to decide on who/when to get married (mean: 54%)
- ▶ 10ppt more likely to influence choice of contraceptive method (mean: 86%)
- ▶ 8ppt less likely to receive brideprice from husband's family (mean: 20%)
- ▶ 4.4ppt more likely to have a civil wedding (gives them greater bargaining power)

Channels

Labor Market:

- ▶ Schooling may increase women's earnings in the labor market by
 - ▶ increasing their labor force participation
 - ▶ changing type of occupation
 - ▶ increasing returns within same type of job
- ▶ we have data on first 2 but not the last mechanism

Marriage Market:

- ▶ Women with higher schooling may marry more educated husbands
 - ▶ a spouse with higher schooling may have better labor market outcomes (similar mechanisms to above)

Household Wealth and Spouse Characteristics

Women who acquired more schooling due to the reform live in wealthier households:

- ▶ household assets index higher by 5%
 - ▶ coming mainly from “*female*” assets
 - ▶ consistent with a change in bargaining power
- ▶ house ownership higher by 8.2 ppt

Weak evidence of assortative mating

- ▶ age of husband is not affected, neither is the age gap (5 years) so husbands’ cohorts are far from the threshold
- ▶ husband’s yrs of schooling is the same but they are more likely to have *graduated* from high school
- ▶ no significant impact on husbands’ labor market outcomes, although they all point in the right direction

Concluding Remarks

Education reform that increased compulsory schooling from 5 to 8 years in Turkey led to:

- ▶ 1 extra year of schooling for women, no effect on men's schooling on average
- ▶ Lower religiosity, more progressive marriage characteristics and higher consumption (durables) for affected women.
- ▶ Transfer of decision rights on key actions to women.
- ▶ Higher labor force participation for women with low mother's schooling
- ▶ Higher husband quality for women with high mother's schooling

Overall, the reform increased women's social mobility out of religiously conservative communities

Future work

- ▶ Child health outcomes
- ▶ Domestic Violence
- ▶ Inter-generational spill-over effects of schooling
 - ▶ Given the age group we are focusing on, we have a large sample of mothers whose children may be affected by the reform
 - ▶ Question: Does a child's (daughter's) schooling affect her mother's attitudes towards:
 - ▶ domestic violence
 - ▶ gender norms
