Statistics on gender and migration

- In 2005, almost half (49.6%) of all migrants were women globally (source: UN)
- In Europe female migrants are as well 51% of the total migrants

Reason to migrate

- Male model: male move first and then women come as family members
- Female model: women move first and the family later
- Additional female model: women move first and are not followed by the family

What do we mean by the ‘feminisation of migration’?

- Increasing stream of women who migrate independently in search of work
- The tendency for some countries to have majority female migrant exports such as the Philippines, East Europeans and in Latin American migration
- Linked to the global demand, particularly in the North and the Gulf, for domestic workers, reproducing the traditional sexual division of labour

Males

Females

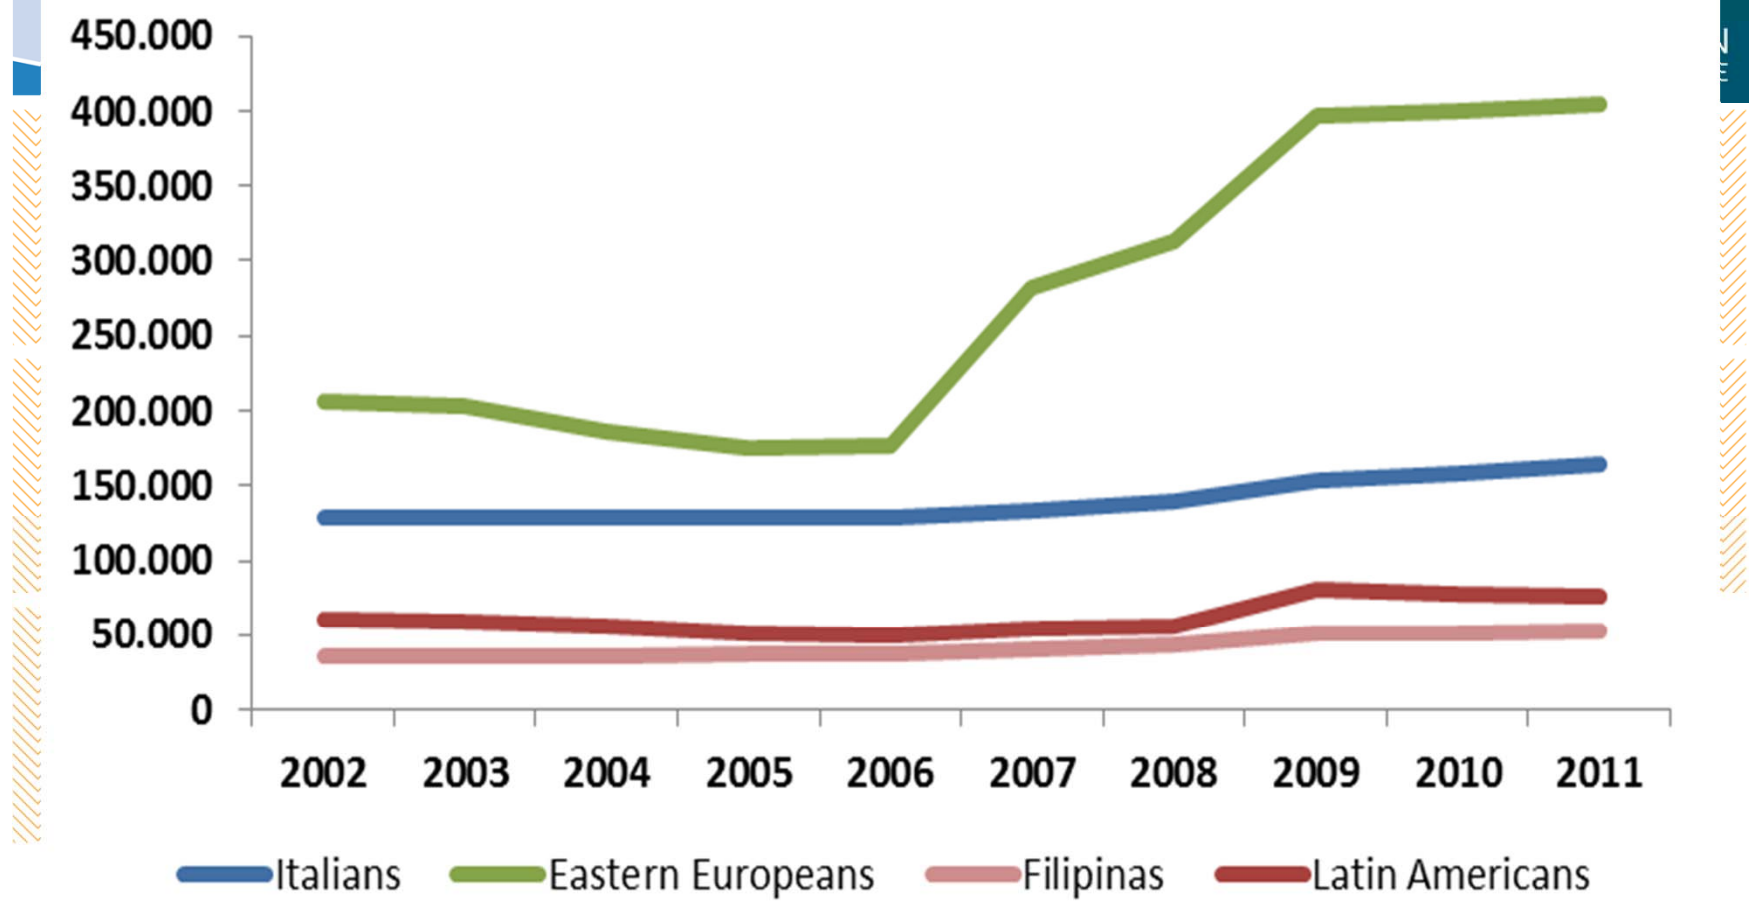

- Technicians and associate professionals
- Plant and machine operators and assemblers
- Domestic workers
- Craft and related trade workers
- Elementary occupations
- Others

Employed women in the paid domestic and care sector by main nationalities, 2002-2011

But in the marriage market?

Daniele Vignoli, Alessandra Venturini, Elena Pirani, 2015,

- ***Are foreign women competitive in the marriage market?***
Evidence from a new immigration country

The marriage market: a stylized model

Two types of agents

- demanding marriage services (men)
- providing marriage services (women)

To get the marriage services the demander provides a remuneration R . The higher the remuneration needed, the lower **the demand**:

$$Q_{ms}^D = Q_0 - aR$$

The higher the remuneration, the larger the **supply of marriage services**. The decision to abandon single life and enter into a marriage implies new duties that may be differently valued by different women: $Q_{ms}^S = Q_1 + bR$

The match between demand and supply determines the **EQUILIBRIUM** amount of marriages Q_e and the equilibrium market remuneration R_e .

$$R_e = (Q_0 - Q_1) / (a + b)$$

An increase of suppliers...

..determines a **shift to the right** of the supply function S_{ms}
→ new equilibrium point E'_0
 corresponding to a lower
 equilibrium remuneration R'_e and
 a higher amount of marriage
 services to Q'_e .

The new R'_e will not be any more
 sufficient for some native **women**
 having a higher reservation
 remuneration. Some of them may
 decide to **abandon the match**,
 or the **male partner** may decide
 not to provide such high
 remuneration, going for a more
 affordable one.

→ The total number of native
 marriages will decline from Q_e
 to Q_n : **marriage disruption**.

Results: educational differentials

High education

Low-medium education

Model	Indicator	OR	<i>P-value</i>	Model	Indicator	OR	<i>P-value</i>

- **Higher educated Italians** : not significant effect of the immigrants' presence on the risk of marital dissolution.
- **Less educated Italians**: risk of *de facto* separation increases as the presence of foreign people (and women) coming from Latin America and Eastern Europe become more relevant.
- **Note**: in Italy the higher risk of marital dissolution is still found for higher educated individuals.

MIGRATION
POLICY CENTRE

Motivations for migration: it's not just economics

- Qualitative studies on migrant women from Latin America show that the desire to escape from abusive marriages, or to leave social stigma behind for divorcees, single childless or queer women are also strong push factors driving migration

Consequences of state gender stereotyping

- The age restrictions promote irregular migration and hence ironically increase womens´ potential to be trafficked and exploited
- Perpetuates the social illegitimacy of non-family based migration

European
University
Institute

ROBERT
SCHUMAN
CENTRE FOR
ADVANCED
STUDIES

- While all migrant workers are vulnerable to discrimination and exploitation in destination labour markets, the concentration of migrant women in the domestic/care sectors exposes them to higher levels of isolation and hence to the risk of abuse and sexual violence
